

EternaGreen™ BioChar Helps Create the Best Soil

EternaGreen™ BioChar reduces the need for fertilizers, enhances crop yields, decreases greenhouse gases and brings new life to our ecosystem. Our BioChar is a Super Premium BioChar produced through the EternaGreen™ Pressurized, Partial Pyrolytic Gasification System. The EternaGreen™ BioChar promise is sustainability.

BioChar is much more efficient at enhancing soil quality than any other organic soil amendment and a more environmentally conscious use of existing resources (Lehmann and Joseph, 2009).

EternaGreen™ Biochar is a fine-grained, highly porous charcoal made from biological material (biomass) and is 100% organic carbon. BioChar is not new. In fact, scientists have found that BioChar was used in Amazon rainforests beginning thousands of years ago to create highly fertile terra preta.

The benefits of EternaGreen™ BioChar include:

- Enhances plant growth
- Increases water permeability and holding capacity
- Increases nutrient retention
- Improves soil structure and stability
- Increases cation exchange capacity
- Reduces soil acidity by raising soil pH
- Adsorbs ammonium, nitrate, phosphate, and calcium ions
- Increases soil activity, fertility and diversity
- Provides refuge for microrhizae
- Improves root development
- Reduce fertilizer runoff, especially nitrogen & phosphorus
- Reduces the amount of fertilizer and herbicides required thus decreasing N2O

Our EternaGreen™ BioChar is sold with a [100% Money Back Guarantee!](#)

[Financing](#) is available for bulk BioChar purchases through Mantria Financial.
